

Project 1 — E-Commerce Sales Intelligence Dashboard

DAY 5

Author: Sudiksha Gunjkar | Tool: Git 2.54 + GitHub | Date: 07 June 2026

Objective

Set up a public GitHub repository, configure Git identity, write a professional README.md with real business findings, and push the complete project codebase. The live GitHub URL is now ready to be added to the resume and shared with recruiters.

GitHub repository summary

```
Paragraph(
'caseSensitive': 1
'encoding': 'utf8'
'text': 'Property'
'frags': [ParaFrag(__tag__='b', bold=1, fontName='Helvetica-Bold', fontSize=9, greek=0, italic=0, link=[], rise=0, text='Property', textColor=Color(1,1,1,1), us_lines=[])] 'style':
'bulletText': None
'debug': 0 )
#Paragraph

Paragraph( 'caseSensitive': 1 'encoding': 'utf8' 'text': 'Value' 'frags':
[ParaFrag(__tag__='b', bold=1, fontName='Helvetica-Bold', fontSize=9, greek=0, italic=0, link=[], rise=0, text='Value', textColor=Color(1,1,1,1), us_lines=[])] 'style':
'bulletText': None 'debug': 0 ) #Paragraph
```

Repository name	ecommerce-sales-dashboard
GitHub URL	https://github.com/sudiksha14/ecommerce-sales-dashboard
Visibility	Public
Objects pushed	57 objects, 52.92 MB total
Branch	main
Git version	2.54.0.windows.1
Auth method	Git Credential Manager — browser-based OAuth
Status	Branch main set up to track origin/main — LIVE

Steps completed

#	Step	Detail	Status
1	Verify Git installation	Ran git --version — got 'git version 2.54.0.windows.1'. Git successfully installed.	Done

2	Configure Git identity	Set user.name and user.email globally using git config --global commands.	Done
3	Create GitHub repository	Created public repo 'ecommerce-sales-dashboard' at github.com/sudiksha14. No README or .gitignore initialised — project already has both.	Done
4	Download and place README.md	Professional README with tech stack, star schema, 3 key findings with real numbers, SQL query descriptions, and how-to-run instructions placed in project root.	Done
5	Initialise local Git repo	Ran git init inside ecommerce-dashboard/ folder.	Done
6	Stage and commit all files	git add . staged 57 objects. git commit -m 'Initial commit: ETL pipeline, EDA charts, SQL queries'	Done
7	Push to GitHub	git push -u origin main — browser opened for OAuth. Authorised Git Credential Manager. 57 objects (52.92 MB) pushed successfully.	Done
8	Fix large file warning	olist_geolocation_dataset.csv (58.44 MB) exceeded GitHub's 50 MB recommendation. Ran git rm -r --cached data/raw/ to remove raw CSVs from Git tracking. .gitignore already excludes data/raw/ so files stay local only.	Done

README.md — sections written

Section	Content
Project title + description	One-paragraph summary: dataset, GMV, what the project covers end-to-end
Tech stack table	Data ingestion, warehouse, SQL, visualisation, version control — all tools listed
Project folder structure	Full directory tree with description of every folder and key file
Star schema design	ASCII diagram + fact/dimension table row counts
Key business findings — Revenue	R\$16.01M GMV, R\$160.99 AOV, Black Friday spike, Monday/Tuesday peak
Key business findings — Delivery	12.5 day avg, 7.9% late rate, northern states 2-3x slower, 2018 spike
Key business findings — Customer	97% one-time buyers, 1.1% Champions, 4.4% At Risk, credit card 74%
Advanced SQL queries section	Rolling revenue, cohort analysis, RFM — each with technique description
EDA charts section	4-section table: Revenue, Delivery, Customer, Advanced — all 15 charts listed
How to run	Step-by-step: pip install, download data, run ETL, EDA, SQL queries
Dataset attribution	Kaggle source link, license, period, size

Challenges faced and fixes applied

#	Challenge	Root cause	Fix applied
1	Git not installed — command not recognised	Git was not installed on the system. PowerShell showed 'git is not recognized as a cmdlet'.	Downloaded Git 2.54 from git-scm.com/download/win . Installed with all defaults. Closed and reopened VS Code to refresh PATH.
2	olist_geolocation_dataset.csv exceeds GitHub 50MB limit	File is 58.44 MB — GitHub recommends max 50 MB. Pushed successfully but with a warning. Could cause issues with cloning.	Ran <code>git rm -r --cached data/raw/</code> to untrack raw CSVs from Git. Committed and pushed the removal. <code>.gitignore</code> already excludes <code>data/raw/</code> permanently.

Week 1 complete — full summary

Day	Focus	What was built	Status
Day 1	Environment + dataset	Anaconda Python, VS Code workspace, 9 Olist CSVs verified (99,441+ rows)	Done
Day 2	ETL pipeline	etl_pipeline.py — 6 clean star-schema tables in data/processed/ (253k rows total)	Done
Day 3	EDA — 15 charts	4 sections: Revenue, Delivery, Customer, Advanced. Real business insights in every title.	Done
Day 4	Advanced SQL	3 DuckDB queries: rolling 30d revenue, cohort retention, RFM segmentation (8 segments)	Done
Day 5	GitHub	Public repo live at github.com/sudiksha14/ecommerce-sales-dashboard with full README	Done

Resume line (add now): github.com/sudiksha14/ecommerce-sales-dashboard

Tech stack confirmed: Python, Pandas, DuckDB, SQL, Git, GitHub, Star Schema, ETL, EDA

Week 1 deliverable: Full data pipeline from raw CSVs to GitHub-hosted analytical project

Key learnings from Day 5

1. Git must be installed separately from Python/Anaconda — it is a system tool, not a pip package.
2. Always close and reopen VS Code after installing Git — the terminal needs to reload PATH to find git.
3. GitHub's Git Credential Manager handles OAuth in the browser — no Personal Access Token needed for HTTPS pushes.
4. Files over 50 MB should be excluded via `.gitignore` before the first commit — removing them after requires `git rm --cached`.
5. A professional README with real numbers (R\$16.01M, 7.9% late rate, 1.1% Champions) is what separates a portfolio project from a tutorial copy.
6. `git rm -r --cached` removes files from Git tracking without deleting them locally — essential for fixing accidental large file commits.

Week 2 plan — Power BI dashboard

Day	Focus
Week 2 Day 1	Load processed CSVs into Power BI, build star schema relationships
Week 2 Day 2	Write 10+ DAX measures: YoY, MTD, rolling avg, KPI flags
Week 2 Day 3	Build Page 1 — Revenue Overview (KPI cards, trend, category breakdown)
Week 2 Day 4	Build Page 2 — Delivery & Operations (state map, late rate, SLA)
Week 2 Day 5	Build Page 3 — Customer Intelligence (RFM slicer, cohort, review score)
Week 2 Day 6	Add RLS, bookmarks, drillthrough, tooltips — publish to Power BI Service
Week 2 Day 7	Streamlit app with same KPIs — deploy to Streamlit Cloud (live URL)
